

Guide on how to use the Casino MANAGEMENT PLATFORM

by www.casinowebscripts.com

We will describe the most important features of the administrator panel .

1.Installation

- 1) Upload files to directory
- 2) Create Mysql database and user for the database and grant the user SELECT/INSERT/UPDATE/DELETE privileges; you can do this from your webhosting account
- 3)CHMOD folder "includes" to 777
- 4) Run `www.{yourwebdomain.com}/install.php`
- 5)CHMOD folder "includes" to 755

Or

- 1) Upload files to directory
- 2) Create Mysql database and user for the database and grant the user SELECT/INSERT/UPDATE/DELETE privileges; you can do this from your webhosting account
- 3) import SQL to database; you can do this from phpMyAdmin
- 4) Edit .htaccess and includes/.htaccess and replace `demov3.casinowebscripts.com` with your `subdomain.websitename.com`
- 5) Edit `includes/connection.inc.php`
- 6) Edit `includes/config.inc.php`
- 7) Login `http://www.{yourdomain.com}/administrator/`

2. Minimum server requirements

- all files and folders must be **755** chmoded
- mail() function should be enabled in order for the registration system to work. Some shared webhosting accounts have this function disabled. Change the hosting provider if so.
- LINUX/WINDOWS server (we recommend LINUX)
- PHP 5
- MySQL 5
- 1 web domain
- The server must have at least 512mb ram (we recommend a VDS solution worth 40-60 EUR per month from any top web hosting provider) to ensure a proper running with a large number of users

It is recommended to start with a small to medium server, and then upgrade to a better server when you will have more users. The server should also have a strong firewall and uptime 100% .

Client CPU requirements:

-512mb ram

-1GHZ CPU

-64mb GPU (Graphical card) . Some games might even work on slower PC's

3. CASINO SCRIPT DESIGN, LOGIC and STRUCTURE

DESCRIPTION

The Casino MANAGEMENT PLATFORM has been developed as a AJAX (Asynchronous JavaScript and XML) WEB APPLICATION to ensure a top class user interactivity, feature that very few online casinos have to offer.

It uses a normal HTML template and it updates required parts of the page directly, without having to refresh the page for the new content to appear.

For this functionality we have used the jQuery library.

The server coding language is core PHP (basic procedural PHP coding) so that any owner of the CASINO SCRIPT would not require advanced knowledge of PHP to make any changes.

All the odds and calculations take place on the server to ensure 100% security and no possibility to trick the odds.

FOLDER STRUCTURE

Inside the root we have:

-**administrator** (it contains all the files related to the administration panel)

-**css** (it contains all the css files that give directions to the browser about how elements will look like and where they will be placed)

-**images** (it contains all the graphics, including flash and favicon, used throughout the casino script)

-**includes** (it contains all the PHP files that are accessed ASYNC by the AJAX engine)

-**jscrip**t (it contains all the JavaScript files like

a)jQuery library – jquery.js and jquerydynamic.php (jQuery is a Javascript library that greatly reduces the amount of code that you must write.)

b) facebox library – facebox.js (the same nice HTML popup that facebook uses, a custom lightbox plugin)

c) casino script custom functions – functions.js (we developed different javascript functions for different functionality, like sending request to PHP to output the HTML that shows the games,

content that is loaded into div 'centermenu')

-login_panel(it contains all the files needed for the top drop down bar to work properly)

-template_files (it contains the images and css files of the current template)

-resources

>>>games_flash(contains the flash games,the PHP of each flash game and the preview images for each game)

>>>logics (contains the common php files that are used by the Video Poker games and Slot games)

APPLICATION FLOW

The casino script updates the content of 4 important divs :

registerDiv,loginDiv,centermenu,leftmenu

-after the user logs in/out , the contents of registerDiv is updated with the output of do_register.php

-after the user logs in/out , the contents of loginDiv is updated with the output of do_login.php

-when user opens the top bar and goes into finances page or tries to edit his details/password or deposit/withdraw, the contents of loginDiv are updated. You must check the PHP files to understand better

-when user logs in/out, clicks on a game category, changes language,views bonuses/transactions/gameplays, the contents of div centermenu are updated ASYNC

SECURITY

-the application has been tested and secured against SQL injections, brute force attackers , XSS, CRLF injections

PHP FILES – what does each of them do ?

index.php

- contains the HEAD data loaded in the DOM (css, javascript functions,doctype)
- contains the top drop-down bar
- it includes the contents of body.php

body.php

- we opted for this structure, to reload the contents of body.php into div 'all' when the language is

changed. This way all the content is translated into the new language flawless

-it contains the menu, game categories , 'leftmenu' div, 'centermenu' div and footer

do_login.php

- outputs the login form when user is logged out
- manages the login request (when login data is sent to the php)
- outputs(includes inside it) the contents of [includes/account.inc.php](#) , when user is logged in

do_register.php

- outputs the register form when user is logged out
- manages the register request (when register data is sent to the php)
- outputs the short gameplay history when user is logged in

do_activate.php

- outputs the form required for the user to complete registration (not to sign up and enter his email ; that is managed by [do_register.php](#))
- after the user completes the registration form on top of the page, an email is sent to him containing a link to this page;

load_page.php

- when javascript function 'showcontent' is called, it sends request towards [load_page.php](#), and the PHP file loads the contents of the requested page from the database
- the page can be seen in action by clicking on any of the top menu links

rules.php

- when the user wants to view the game rules loaded into div 'leftmenu',facebox loads the page into a popup, and sends the parameter of the game for which to show the rules. 'rules.php' loads the rules from the database of the requested game id
- the page can be seen in action by clicking on a game category and then clicking on the RULES from the left

launch_game.php

- when the user clicks to play a game and lighbox popup is turned OFF from admin, the [launch_game.php](#) page is opened in a new window and it loads the requested flash game into the page
- the page can be seen in action by clicking on a game category and then clicking on a game

play.php

- when the user clicks to play a game and lighbox popup is turned ON from admin, the [play.php](#) page is opened in a lightbox popup and it loads the requested flash game into the page
- the page can be seen in action by clicking on a game category and then clicking on a game

INCLUDES

`./acc_change_details.inc.php`

- outputs the form that allows the user to change his personal details to div 'loginDiv'
- page can be viewed by logging in, opening the top bar and clicking 'Change details'
- if the user decides to proceed and change his details, the data is sent to `do_acc_change_details.inc.php`, using ajax and javascript function 'doChangeMyDetails', that loads the data from each input id using javascript ('#id').val() and then passes it to the PHP; the content outputted by the PHP is then loaded into div 'loginDiv'

`./acc_change_pw.inc.php`

- outputs the form that allows the user to change his password to div 'loginDiv'
- page can be viewed by logging in, opening the top bar and clicking 'Change password'
- if the user decides to proceed and change his password, the data is sent to `do_acc_change_pw.inc.php`, using ajax and javascript function 'doDeposit()', that loads the data from each input id using javascript ('#id').val() and then passes it to the PHP; the content outputted by the PHP is then loaded into div 'loginDiv'

`./acc_close.inc.php`

- outputs the form that allows the user to close his account to div 'loginDiv'
- page can be viewed by logging in, opening the top bar and clicking 'Close account'
- if the user decides to proceed and close his account, the data is sent to `do_acc_close.inc.php`, using ajax and javascript function 'doClose()', that loads the data from each input id using javascript ('#id').val() and then passes it to the PHP; the content outputted by the PHP is then loaded into div 'loginDiv'

`./acc_deposit.inc.php`

- outputs the form that allows the user to make a deposit to div 'loginDiv'
- page can be viewed by logging in, opening the top bar and clicking 'Finances' and then 'Deposit'
- if the user decides to proceed and complete the deposit to his account, the data is sent to `do_acc_deposit.inc.php`, using ajax and javascript function 'doDeposit()', that loads the data from each input id using javascript ('#id').val() and then passes it to the PHP; the content outputted by the PHP is then loaded into div 'loginDiv'

`./acc_redeem.inc.php`

- outputs the form that allows the user to redeem a prepaid coupon to div 'loginDiv'
- page can be viewed by logging in, opening the top bar and clicking 'Finances' and then 'Redeem Coupon'
- if the user decides to proceed and redeem the coupon to his account, the data is sent to `do_acc_redeem.inc.php`, using ajax and javascript function 'doRedeem()', that loads the data

from each input id using javascript ('#id').val() and then passes it to the PHP; the content outputted by the PHP is then loaded into div 'loginDiv'

./ acc_withdraw.inc.php

- outputs the form that allows the user to request a withdrawal to div 'loginDiv'
- page can be viewed by logging in, opening the top bar and clicking 'Finances' and then 'Withdraw'
- if the user decides to proceed and complete the deposit his account, the data is sent to **do_acc_withdraw.inc.php** , using ajax and javascript function 'doWithdraw()', that loads the data from each input id using javascript ('#id').val() and then passes it to the PHP; the content outputted by the PHP is then loaded into div 'loginDiv'

./ account.inc.php

- outputs the links to Change details,Change pass,finances,etc as well as the user details into div 'loginDiv'
- page can be viewed by logging in

./ bonuses.inc.php

- outputs the bonuses of the user into div 'centermenu'
- page can be viewed by logging in, opening the top bar and clicking 'Finances' and then 'My Bonuses' on the right

./ captcha.inc.php

- generates the IMAGE that shows the CAPTCHA code and stores the numeric value into session; file is used to avoid spam registrations

./ check_pw.inc.php

- PHP function that calculates the strength of the password entered by the user when he tries to change his password

./ config.inc.php

- contains the main configuration file that manages the session, language include ,database connection include, functions include

./ connection.inc.php

- manages the MySQL database connection

./ contact.php

- outputs the form that allows the user to contact the casino team;outputs it to div 'centermenu'
- page can be viewed by clicking 'Contact' from menu

- modifications can be made to change the email format or email username
- if the user decides to proceed and complete the contact form, the data is sent to **contact.php(self)** , using ajax and javascript function '**doContact()**' , that loads the data from each input id using javascript (\$('#id').val()) and then passes it to the PHP; the content outputted by the PHP is then loaded into div '**loginDiv**'

./ dd_select_lang.inc.php

- outputs the form that allows the user to change the language of the website
- if language is changed, javascript function changelang() is executed

./ do_name.inc.php

- PHP checks if user is logged in, and if so, it outputs Username and balance ,otherwise it outputs 'Hello, Guest'
- content is loaded inside div '**showname**'

./ do_status.inc.php

- loads the content into the div that shows the button for opening the top bar
- PHP checks if user is logged in, and if so, it outputs 'My Account' ,otherwise it outputs 'Log In | Register'
- content is loaded inside div '**open**'

./ dd_select_lang.inc.php

- outputs the form that allows the user to change the language of the website
- if language is changed, javascript function changelang() is executed

./ doRedeem.inc.php

- redeems a deposit bonus, after the money have been played X times

./ finances.inc.php

- outputs the links to deposit,withdraw,redeem,transactions as well as the user profit statistics into div '**loginDiv**'
- page can be viewed by logging in, opening the top bar and clicking '**Finances**'

./ functions.inc.php

- contains PHP functions used throughout the whole script;contains functions like send_mail(that allows to send HTML email), checkloggedin(allows to check if user is loggedin)

and others.

./ gamescfg.inc.php

- contains the common configuration for the games

./ gamesfc.inc.php

- contains the common functions for the games
- contains functions like : TRNG (True Random Number Generator) function, updatebalance (updates the balance of the user and of the casino bank) , casino_odds(calculates win odds and maximum allowed win),check_jackpot_5rs(checks for jackpot)

./ gameslide.inc.php

- outputs a small list of 2 games
- it loads the content into div 'leftmenu' , using ajax and javascript functions like showcontent and ajaxgamestype
- page can be viewed by clicking on page from the top menu

./ leftgames.inc.php

- outputs the list of games and by clicking them you can see the rules
- it loads the content into div 'leftmenu' , using ajax and javascript functions like showcontent and ajaxgamestype
- page can be viewed by clicking on a game category

./ referafriend.inc.php

- outputs the refer a friend form
- manages the refer a friend request (when data is sent to the php) and sends an email to the user's friend

./ showgames.inc.php

- outputs the list of games with images, text and "Play for Fun" and "Play for Real" links
- it loads the content into div 'centermenu' , using ajax and javascript function ajaxgamestype
- page can be viewed by clicking on a game category

./ points_shop.inc.php

- outputs the list of products if the points system is enabled
- it loads the content into div 'centermenu'
- page can be viewed by activating Points System and clicking 'Finances' and then 'Exchange Points'

- if the user decides to proceed and order any of the products, the data is sent to [points_shop_do.inc.php](#) , using ajax and javascript function 'askAddress (id)'; the content outputted by the PHP is then loaded into div 'centermenu'

[./ transactions.inc.php](#)

- outputs the transactions of the user into div 'centermenu'
- page can be viewed by logging in, opening the top bar and clicking 'Finances' and then 'View all transactions'

[./ translate.inc.php](#)

- translate any word into the current selected language (language value is taken from \$_SESSION['language'])

[./ transfer.inc.php](#)

- outputs the form that allows the user to transfer money to a friend; it loads the form into div 'loginDiv'
- page can be viewed by logging in, opening the top bar and clicking 'Finances' and then 'Transfer Money'
- if the user decides to proceed and complete the deposit to his account, the data is sent to [transfer.inc.php](#)(self page), using ajax and javascript function 'doTransfer()' , that loads the data from each input id using javascript (\$('#id').val() and then passes it to the PHP; the content outputted by the PHP is then loaded into div 'loginDiv'

4. Games Workflow/Logic

The logic of the games has been developed to bring profit to the casino owner.

When a game is played, all the action and calculations are made inside the PHP of the game.

Flash is used just for animations and user interactivity. By doing so the games are 100% secured against and client listeners.

When the user places a bet , the amount is subtracted from the user's balance, if he has enough money (otherwise he will get an error message from both PHP and FLASH) and a part of the money goes into casino bank and a part into profit .

The TRNG generates now the symbols/numbers/cards , depending on the game.

Flash calculates the potential win using the combination generated by PHP. If the casino has enough money in the casino bank to pay the user, then PHP will update balances accordingly and send the data to flash, otherwise, PHP will calculate a combination that will make the user win less or win nothing, PHP will update balances accordingly and it will send this new data to FLASH.

Flash outputs the results and the win.

Casino never loses !
