

Global mode – this is a variable that determines if all games share same casino bank, same win% (if global mode = 1) or if each game has it's own bank and win% (if global mode = 0)

includes/connection.php – contains the code that connects the software to the database. In the database all the important data is stored , like : user credentials, game authentication data, gameplays details , deposits, withdrawals, game odds , casino bank, casino payout %, casino win % and more

includes/functions.inc.php – contains the security functions that help the software to filter any input data against malicious attacks , or against incorrect data. These functions are used throughout the software web interface and administrator panel.

includes/config.inc.php – contains the common variables used throughout the software web interface , games and administrator panel.

includes/gamesfc.inc.php – the most important file. Contains the heart of the casino software. Inside this file you can find the following PHP functions :

***casino_rand** – this is the RNG that is used everywhere throughout the software and games. If you want to implement your own RNG, then you must edit this function.*

***updatebalance** – this function updates the player balance , accordingly to his action (if he placed a bet or if he won), and inserts the gameplay details to the database (table **cws_gameplays**) , so that you can check later how did the player win/lose and explain to your players if they claim that the game didn't pay them correctly.*

*If you want to integrate our games with your database and platform, you can edit this function, and edit the **mysql_query** functions , so that it points to your tables and to your correct table columns. Don't forget to also edit "**increase_jackpot**", "**casino_odds**" and other*

*functions ("increase_fs_bank",
"increase_mega_bank","get_bank","update_bank","get_rnd_perc")*

increase_jackpot – this function updates the jackpot value for each game from the database. If you want to make global jackpot (one single jackpot for all the games) , you can simply edit this function.

casino_odds – with the help of the RNG function , and with the help of the RANDOMNESS INFLUENCER , from the database, this functions helps determine the odds of each game (the maximum win for a hand)

the RANDOMNESS INFLUENCER is located in table "bank_tbl" – coef (for play for real) and funcoef (for play for fun).It can also be edited from the admin panel. If this is set to 100 , then all the odds are RANDOM , as long as the casino has money to pay. If this is set to 100, and player bets 1000\$ and in bank we have only 100\$, then the game will return a losing hand for the game.

If you want to have global jackpot, you must edit function "increase_jackpot" (this function adds a percentage from each bet to jackpot . You must edit the function to point to table "bank_tbl ", column "jackpot_global" , and remove the WHERE condition from the query).

You must also edit file "[resources/logics/slots/5rs.php](#)" , line 712, to point to table "bank_tbl", column "jackpot_global" , and remove the WHERE condition from the query.

You must also edit file "[includes/gamescfg.inc.php](#)" , and edit lines 41 and 42 to point to table "bank_tbl" , column "jackpot_global" , and remove the WHERE condition from the query.
